LogMaster-400

Standalone Single/Multi-Line Voice Logger with Network Based Expandability

LogMaster™ is a family of digital voice loggers capable of recording either one line (model LogMaster™-100) or four lines (model LogMaster™-400) of telephone calls. It offers standalone operation to serve small installations, yet allows the connection of multiple units via network to also serve large installations. Built upon cutting edge technologies, LogMaster™-100 are LogMaster™-400 are the direct upgrades of VLAN-100SD and VLAN-400SD respectively.

The system is equipped with a large amount of internal flash memory capable of storing hundreds of hours of phone conversations with superb sound quality. It is also possible to override the internal memory with a plug-in USB drive for personalized storage. This feature allows the system to be shared among several users with maximum privacy – a unique feature not available from the competitors.
In addition to phone conversations, the system also records other useful information such as caller ID, dialed number, number of rings before answer, and duration of the call. Record files can be reviewed conveniently with the built-in keypad/LCD interface, accessed from a remote PC via the Internet, and/or uploaded to a network storage unit for centralized data management.

For medium to large installations, multiple LogMasters can be networked together and managed with the optional Grand Voice Logger System. This system architecture offers the benefits of both small loggers (local storage, quick access and easy installation) and big loggers (expandability, web access and centralized management). Regardless of your business size, LogMaster™ is surely the best solution for your logging needs.
